8.2 Exposure controls

Appropriate engineering controls

Handle in accordance with good industrial hygiene and safety practice. Wash hands before breaks and at the end of workday.

Personal protective equipment

Eye/face protection

Safety glasses with side-shields conforming to EN166 Use equipment for eye protection tested and approved under appropriate government standards such as NIOSH (US) or EN 166(EU).

Skin protection

Handle with gloves. Gloves must be inspected prior to use. Use proper glove removal technique (without touching gloves outer surface) to avoid skin contact with this product. Dispose of contaminated gloves after use in accordance with applicable laws and good laboratory practices. Wash and dry hands.

Body Protection

impervious clothing, The type of protective equipment must be selected according to the concentration and amount of the dangerous substance at the specific workplace.

Respiratory protection

Where risk assessment shows air-purifying respirators are appropriate use a full-face particle respirator type N100 (US) or type P3 (EN 143) respirator cartridges as a backup to engineering controls. If the respirator is the sole means of protection, use a full-face supplied air respirator. Use respirators and components tested and approved under appropriate government standards such as NIOSH (US) or CEN (EU).

Carcinogenicity

ALADDIN SCIENTIFIC CORPORATION

3 - Group 3: Not classifiable as to its carcinogenicity to humans (Cimetidine)

Reproductive toxicity

Reproductive toxicity - mouse - Intraperitoneal Effects on Newborn: Biochemical and metabolic. Reproductive toxicity - rat - Oral Effects on Fertility: Post-implantation mortality (e.g., dead and/or resorbed implants per total number of implants). Reproductive toxicity - dog - Intravenous Paternal Effects: Prostate, seminal vesicle, Cowpers gland, accessory glands. Reproductive toxicity - rat - Oral Paternal Effects: Prostate, seminal vesicle, Cowpers gland, accessory glands. May cause reproductive disorders. In some rat studies Cimetidine has shown a delay in development of the prostate and seminal vesicles and an impairment of sexual maturation in male offspring exposed antenatally to this drug some concern exists that prolonged fetal exposure to this agent may inhibit normal masculinization in a male fetus. In rat experiments, large doses administered over a period of six months reduced the size of the testes, prostate gland, and seminal vesicles. Cimetidine has been clearly associated with antiandrogenic effects in adult humans. These effects include the occasional development of gynecomastia and a decline in sperm count (without loss of fertility) among men treated with this drug.

Specific target organ toxicity - single exposure

no data available

Specific target organ toxicity - repeated exposure

no data available

Aspiration hazard

May be harmful if inhaled. May cause respiratory tract irritation.
